Geo – Sofa *Sergio Bicego, 2018*

Sometimes a name can say a lot, sometimes it says everything. Geo is an all rounded project. The proportions have been designed with upmost attention to detail and with careful observation it will be noticed that the arm width is slightly different to that of the back, the ergonomic needs are different, and it has been a design choice to steer clear from a more typical uniform width that goes right around the entire armchair. The seat itself has less padding compared to the arms which are designed to hug the body. Every detail has been carefully studied to give life to a special object where the main volume of the seat and the very light volume of the legs find a unique harmony together. The metallic structure adds a luxurious feel to the object and is made for easy cleaning.

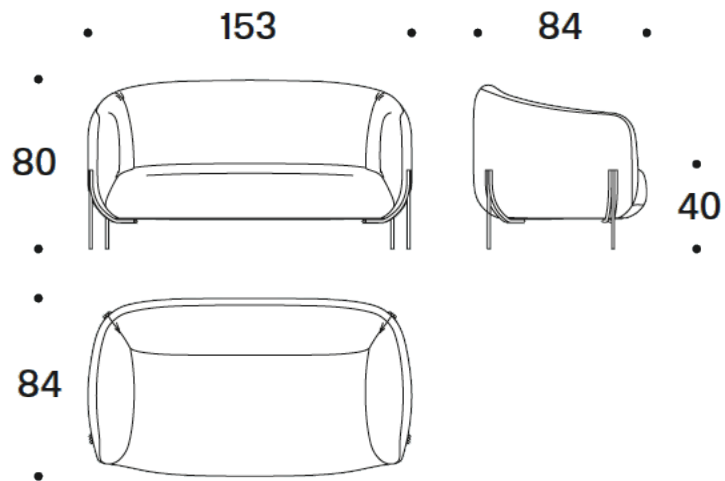

Materials

The internal structure is made from Polimex (a technical material with excellent structural properties and very light weight). It is upholstered in foam. The legs are finished in satin brass, anthracite and polished copper.
